

Beyond the Demo: Building Trusted AI Agents with MCP

A startup story, an enterprise reality,
and lessons from a production MCP codebase.

Konstantin Grigorov

Principal Data & AI Engineer · Shell Trading & Supply

20 OCT 2026 · RAI AMSTERDAM

AI DEVELOPER · 12:05-12:35

Fictional story. Real failure modes.

You are the founding engineer.

Team of 9. Funding secured. Friday demo.

GOAL: CONNECT AN LLM TO REAL DATA THROUGH MCP

*Trusted users. One identity path. One team.
A tool catalogue small enough to understand.*

9
PEOPLE

ASSUMPTION DEBT

Small solutions are safe only while
their hidden assumptions remain true.

A practical MCP implementation

THE DESIGN PRINCIPLE

A deterministic spine around a probabilistic model.

The model interprets language. Code constrains execution.

OUTPUT ADAPTERS

Table

CSV

Excel

Chart

Map

STARTUP QUESTION: HOW DO WE CONTROL WHAT THE MODEL DOES?

Discovery outpaces approval

REGISTRY ≠ ENDORSEMENT

Customer acquisition: the VC arrives

PRIORITY CUSTOMER

“Can your agent analyse my portfolio?”

Nothing clarifies product priorities like consequences.

BAYC FLOOR · ETH

MEME TOKEN · USD

THE REQUIREMENTS CHANGE

- 👁️ Can another user see my data?
- ⚡ Can the agent invoke a write tool?
- 🔄 Can I reproduce the answer?

Milestone illustration, not a daily price series.

Production expands the control surface

Identity & entitlements

Delegated JWT · dataset grants

Least privilege

Read-only SQL · exact relations

Guardrails

AST validation · fail closed

Audit & telemetry

Request ID · route · outcome

Evidence & provenance

Dataset · SQL · source metadata

Tests & release gates

470 passed · lint · security scans

STARTUP

Implement controls inside one product.

ENTERPRISE

Enforce controls consistently across every product.

TRUST = CONTROL + EVIDENCE

Trust becomes executable in the control path

470

tests passed

with 89% coverage
in the reviewed CI run.

0 server-side LLMs.
The client owns the tool loop.

status: 'access_denied'
terminal: true
next_action: 'stop'

Machine-readable denial from the authorization layer

25

registered MCP tools

4

indexes and caches
loaded at startup

DENIAL TERMINATES THE ROUTE

“This might take longer.”

Accuracy starts with routing and ends with evidence

1

Preserve the prompt

Keep the user's original wording

2

Explicit route

Return one required next step

3

Trusted template

21 fixed patterns before discovery

4

Hybrid retrieval

70% lexical · 30% vector

5

Schema + safety

Exact columns · every SQL relation

6

Execute + evidence

Authorize · read-only · request ID

CONFIDENCE GATE

LOW

HIGH

No confident
match?
Ask or stop.

SERVER

returns next step

CLIENT

calls next tool

Routing guidance is advisory; SQL safety and authorization are enforced.

REPEATABILITY COMES FROM THE ROUTE AND THE EVIDENCE

The data contract enters the routing layer

VENDOR DATA AGREEMENT

- ❌ AI processing restricted
- ❌ No model training
- ❌ Licensed users only
- ❌ No raw redistribution
- ❌ Derived use controlled

The policy must shape routing
before the model sees the data.

Separate relevance from permission.

Terminal denial

access_denied · next_action: stop

Metadata only

Discover without raw content

Compute beside data

Return approved aggregates

Private inference

No-retention endpoints

Governed views

Approved derived products

Synthetic evals

Test without licensed records

CONTRACT TERMS BECOME POLICY INPUTS

The platform around a domain MCP server

CHANNELS + PERSONAS

The dividing line

STARTUP

**Control the route
and the output.**

Client loop · routing · accuracy · UX · cost

ENTERPRISE

**Control every identity, tool and
dataset,
then retain the evidence.**

Authorization · licensing · policy · audit · operations

MAKE IT WORK

MAKE IT REPEATABLE

MAKE IT GOVERNABLE

THANK YOU
